

Raspberry Pi Audio

A sample document for contextual file retrieval.

Project AudioLab

This demonstration file discusses USB microphones, audio capture, and Raspberry Pi recording workflows. It is sample content, not a hardware configuration guide or a claim that a particular microphone is supported.

Try opening this PDF in the WhiteBoardOS viewer. That creates a human viewing event. Background indexing and agent reads do not create one.

After activity exists, search using a topic and a calendar time window. WhiteBoardOS combines indexed text, locally generated metadata, and recorded viewing events to return candidates with supporting timestamps.

No viewing history is preloaded. Yesterday queries only succeed when an actual matching event exists for that local calendar day.
